Methodology overview (v1.0.9)

A plain-English description of what the tool is (and is not) designed to do.

Purpose

The indicator is designed to confirm cycle-level conditions on XRP using clear labels and optional context overlays. It is not a prediction engine and it does not remove uncertainty.

Timeframe + evaluation

- Primary design point: 1W (weekly) charts.
- Confirmations evaluate on the weekly bar close.
- Some staging cues can appear intra-week; they are not confirmations until the bar closes.

Alerts

- Alerts are intended to reduce screen-watching, not to replace decision-making.
- Use the alert triggers guide to set a conservative alert cadence.

Backtests and examples

- Any backtest or example is hypothetical and for education only.
- Small sample sizes can distort ratios and look extreme.
- Regime shifts happen; behavior can change out-of-sample.

> Use the tool inside a written plan. Avoid leverage. Size positions so you can survive being wrong.
