FREQUENTLY ASKED QUESTIONS

Plain-English answers for businesses.

First the hidden problem. Then why familiar options fall short. Then why Bitcoin. Then why Reserve Standard makes the weekly job calmer — and what the order of operations actually is.

The hidden reserve problem

What problem does a business have before it ever buys Bitcoin?

The moment the month is covered and the business still keeps cash, it has to decide what that money is for. Some dollars keep the lights on. Some buy safety. Some stay ready for clear opportunities. Whatever is truly left over becomes long-run reserve — whether the owner planned it or not.

Why is leaving extra cash in dollars a problem?

Purchasing power is the truth. Dollars are useful for immediate obligations but weak for long-duration savings. They give access. They do not preserve scarcity. Leave true reserve cash in dollars too long and its purchasing power keeps crumbling.

Why not just reinvest every spare dollar back into the company?

When the business has an obvious high-return use for capital, it often should. The point is that not every extra dollar has the same best use at the same moment. Healthy companies still need separation between operating cash, safety cash, opportunity cash, and true reserve cash.

FREQUENTLY ASKED QUESTIONS

Why Bitcoin wins

Why not use stocks, real estate, or gold for reserve instead?

Each carries impairments Bitcoin avoids. Stocks are still paper claims on businesses. Real estate is heavy, local, taxed, and often tied to leverage. Gold points toward scarcity, but it still carries analog limits in movement, custody, settlement, division, and verification. Bitcoin keeps the hard-money idea and improves it for a digital operating world.

What makes Bitcoin different as reserve money?

Bitcoin is the hardest asset ever engineered. Digital money built to beat the debasement weakening every other store of value. Gold is scarce by what we can currently access; Bitcoin is scarce by mathematical law. Fixed supply, direct ownership, digital liquidity, portability, divisibility, and easy verification.

What do you mean when you say Bitcoin has built-in alpha?

Its asymmetry is structural. Fixed supply in a world of expanding currency, debt, and claims means a scarce asset can keep repricing against weaker money as adoption grows. That is very different from an asset that depends on dilution, leverage, or management execution.

Isn’t Bitcoin too volatile to be a reserve asset?

Volatility on a single-week or single-quarter view is real and irrelevant to the long-run treasury job. The reserve bucket is judged on a decade horizon — the same horizon Bitcoin has compounded against weakening currency. The operating system around it is what carries the business calmly through the volatility.

FREQUENTLY ASKED QUESTIONS

Why Reserve Standard exists

If Bitcoin is the right reserve asset, why is blind buying not enough?

Bitcoin solves the asset problem. Reserve Standard solves the execution problem. The business still has to protect operations, preserve ready cash, and survive volatility without the plan breaking. Most business Bitcoin plans aren't optimized — they add stress, drift, and break under stress.

What does Reserve Standard actually fix?

It protects operating cash first, keeps emergency and opportunity cash liquid, and collapses reserve building into one clear weekly action and amount. Less noise. Less stress. Less second-guessing. Less chance the plan gets rewritten by emotion.

How simple is the weekly job once Reserve Standard is set up?

Open the model. Read the action and amount. Execute it. Move purchased BTC to storage. Log it and move on. The discipline starts with the first dollar — always allocate a percentage of every dollar earned, no matter how small. The goal is not more screen time. The goal is a reserve process calm enough to survive real business life.

What does the engagement actually look like?

Reserve Review (maps cash by job, defines the real reserve bucket, evaluates fit). Policy + setup (rules, guardrails, custody, dashboard, Team Reserve if extending to employees). Weekly operating layer. Review and maintenance to keep the process stable across cycles.

FREQUENTLY ASKED QUESTIONS

The order, the team, the guardrails

Why hold Bitcoin on the company balance sheet instead of just paying myself and buying personally?

The order is the strategy. Capitalize the company first. The dollars buy more Bitcoin (tax efficiency at the conversion point), the balance sheet gains strength personal BTC cannot give it, the business gains operational firepower when others can't act, and the reserve outlives any single owner through partner buyouts and succession. If the foundation gives way, the wallet stops getting filled — no matter how disciplined the buying was.

What about the team?

Reserve Standard's Team Reserve doctrine gives every employee free access to the same tool the business uses, plus education on how to apply it personally. No employer match, no payroll deduction, no employer-executed purchases in the first stage — legally clean and immediately deployable. A company that lets its team accumulate sound monetary energy alongside it is healthier, more loyal, and harder to compete with as the era of paying workers in weakening dollars comes to an end.

Is this trading?

No. Reserve Standard is built around treasury policy, liquidity protection, and disciplined long-term accumulation — not trading calls. There are no "signals," "indicators," or "entries" to react to. The system is built to be calm, repeatable, and reviewable across decades.

Who is this for, and who is it not for?

Reserve Standard is for businesses that take treasury seriously — small, medium, and large — and that want a maintained system rather than an ad-hoc weekly debate. It is not for businesses looking for trading recommendations, fast personal speculation, or a custody service. The first conversation is a Bitcoin Treasury Review at review@reservestandard.com.
