AZRO SYSTEMS

Invite-Only TradingView Indicator

XRP Top/Bottom Indicator Documentation Pack

Version v1.1.0 • Updated 2026-03-06

Includes: methodology and signal handbook • quick-start and alert setup • strategy playbooks • risk management • troubleshooting • validation notes • legal appendix
Companion sheets in the customer kit: Start Here • Quick Reference • Alert Setup Card • Strategy Playbook Card • Weekly Close Checklist

Indicator page: AZRO Systems — XRP Top/Bottom Indicator (Invite-Only)

Product / access page: AZRO Systems Gumroad

Support: support@azrosystems.com

Customer documentation for the AZRO Systems XRP Top/Bottom Indicator. This v1.1.0 pack preserves the same customer labels, alert flow, and weekly operating model while updating the recommended XRP chart basis and live-use guidance.

Inside this documentation pack

Use this pack in order the first time. The companion sheets are built for faster day-to-day execution once the full workflow is familiar.

1. How the indicator works - Methodology, signal stack, trust architecture, and operating scope.

2. Quick-start, Mind-Set & Beginner Safety Brief - Quick lens, beginner safety, first setup, and first-week workflow.

3. Installation and first-chart setup - Invite-only access flow, TradingView setup, first-use checklist, and chart standards.

4. Signal scope, legend, and operating rules - Exactly what can print, where it prints, and how to interpret each output.

5. Alert setup guide - Correct named conditions, trigger selection, optional automation, and common mistakes.

6. Strategy playbooks - Optimized workflows for investors, hybrids, and more active traders.

7. Risk management and workflow discipline - Layered positioning, DCA/stops discussion, hidden costs, and weekly process.

8. Settings guide - Every major input explained, plus default operating mode and profile presets.

9. Troubleshooting and FAQ - Common user issues, platform banners, invite-only access, updates, refunds, and support.

10. Validation, performance, and robustness - Illustrative strategy comparisons, test philosophy, and how to judge reliability.

11. Resources, support, and legal appendix - Support links, platform resources, risk disclosure, privacy, terms, and the master disclaimer.

Read this first

This guide is built for real customer use on the 1W chart. It shows how to set up the indicator, understand each output, configure the correct alerts, run the main investor / hybrid / trader playbooks, and manage risk with a calm weekly process.

Use the companion sheets for faster execution:

- Start Here - first 10 minutes, first week, and what normal use looks like.
- Quick Reference - desk-side summary of the signal ladder, triggers, defaults, and common mistakes.
- Alert Setup Card - exact named conditions, triggers, and the support-ticket mistakes to avoid.
- Strategy Playbook Card - sanctioned investor / hybrid / defensive workflows and signal-to-action rules.
- Weekly Close Checklist - the repeatable weekly ritual for calm execution and review.

1. How the indicator works - Methodology and tear-sheet overview

The AZRO Systems XRP Top/Bottom Indicator is a weekly-cycle indicator for XRP. It is built to help users identify statistically meaningful accumulation and distribution windows on the 1-week chart without relying on constant lower-timeframe monitoring. The indicator is intentionally cycle-oriented: MAJOR and RADAR labels are meant to anchor higher-conviction decisions, while EARLY, LIGHT, RISK, and the optional risk-colored XRP line provide supporting context rather than replacing confirmation discipline.

- Primary use-case: timing major XRP cycle bottoms, tops, and de-risking windows on the weekly chart.
- Primary users: long-term investors, swing traders, hybrid users who keep a core while actively trimming and adding around cycle extremes, and lower-timeframe traders who want a higher-timeframe directional filter.
- What it is not: an intraday signal generator, a black-box profit guarantee, or a substitute for position sizing, execution discipline, taxes, or personal risk planning.
- Customer-operating principle: the pack explains how to use the indicator clearly and consistently on live weekly charts, with written playbooks and defined alert discipline.

Who this indicator is for

Approach	Strength	Trade-off
Buy and hold	Maximum simplicity; zero timing workload.	Can tolerate very deep drawdowns and long underwater periods.
Pure discretionary DIY cycle trading	Flexible and highly customizable.	Easy to overfit, overreact to news, and change rules mid-cycle.
AZRO MAJOR-Only	Simple ruleset with a clear weekly decision cadence.	Still gives back more near tops than an active trim ladder.
AZRO Core + Trim Ladder	Adds structured de-risking while preserving the weekly framework.	Requires written trim sizes and better execution discipline.
AZRO Weekly-Bias + own execution	Powerful for advanced users with a separate method.	Only as good as the lower-timeframe execution system attached to it.

Output stack

Output	Where	Timing	How to think about it
MAJOR TOP / MAJOR BOTTOM	XRP only	Weekly close	Primary cycle confirmations and highest-priority anchors.
RADAR TOP / RADAR BOTTOM	XRP only	Weekly close	Complementary confirmation track. RADAR TOP remains important for top calls; RADAR BOTTOM is optional tactically but ON by default in v1.1.0.

EARLY TOP / EARLY BOTTOM	XRP only	Intra-week / can disappear by close	Heads-up staging layer. Useful for advanced users who intentionally want earlier but less stable information.
LIGHT TOP / LIGHT BOTTOM	XRP only	Weekly close	Local structure-aware timing cues for context only. Not required for core playbooks and OFF by default.
RISK / HIGH RISK triangles	XRP and optional on non-XRP	Weekly close	Elevated caution markers for trims, tighter risk, or smaller adds. Context layer, not a replacement for MAJOR/RADAR confirmations.
Risk-colored XRP price line	XRP 1W only	Weekly close context	Optional visual regime overlay for the XRP price line. No labels and no alerts; purely visual context.
Health banner / 1W reminder	Visual-only	Live view	Operational aids. They do not create signals; they warn about timeframe mistakes, chart-basis problems, or degraded data states.

Trust architecture

Why users trust the workflow	What that means operationally
Weekly-close architecture	The system is intentionally designed around weekly closes so users make fewer, higher-quality decisions and are less exposed to intrabar noise.
Confirmation vs context separation	MAJOR and RADAR remain the core confirmation layer. EARLY, LIGHT, RISK, and the risk line help with planning and risk management without diluting what counts as a real cycle call.
Data-health awareness	The script surfaces a live health banner when confirmations are temporarily suppressed or degraded by data conditions instead of silently failing.
Invite-only distribution	Customers receive a locked, invite-only TradingView script. This preserves IP and keeps customer operation simple: use the outputs, not hidden knobs.
Alertable workflow	The outputs can be set up as named TradingView alerts so users do not need to watch the chart constantly.

Tear-sheet summary	
Operating pillar	Customer takeaway
Weekly-close model	Use the indicator on the 1W chart and make confirmation decisions on the weekly close.
Top-side stack	Keep MAJOR TOP and RADAR TOP active together. The first confirmed top-side print at the close is the practical call.
Bottom-side stack	MAJOR BOTTOM is the clean anchor. RADAR BOTTOM is optional if your plan allows tactical adds or secondary confirmation.
Risk stack	RISK / HIGH RISK are serious caution markers for trims, tighter risk, smaller adds, or portfolio-level de-risking.
Non-XRP scope	Optional non-XRP RISK triangles are macro context only. They are not XRP-style buy/sell confirmations.

Known limitations

- All confirmation logic is designed for the 1-week chart. Lower timeframes are off-label usage.
- A weekly-close model is not designed to catch the exact top tick or bottom tick. Its job is to identify high-value cycle windows with less noise and less emotional churn.
- TradingView data, reference series, and alert infrastructure are third-party dependencies. Delays, gaps, or feed changes can affect what the user sees.
- Settings that change what can print will also change historical classification under those settings. Visual-only settings do not change signals.
- Any performance snapshot must be treated as hypothetical and implementation-sensitive. Fees, delayed execution, venue choice, and user behavior matter.
- Even a strong indicator is still not financial advice. Risk management, taxes, jurisdiction, and suitability remain the user's responsibility.

2. Quick-start, Mind-Set & Beginner Safety Brief

Quick lens
• This indicator is built for weekly cycle decisions, not fast trading noise.
• Most users should start with confirmed MAJOR and RADAR outputs, not EARLY or LIGHT.
• For top calls, keep MAJOR TOP and RADAR TOP alerts active together. Act on the first confirmed top-side signal that prints at the weekly close.
• For bottoms, MAJOR BOTTOM is the cleanest anchor. RADAR BOTTOM can be used tactically as an optional add or secondary confirmation path.
• RISK / HIGH RISK are serious caution markers for trims, tighter risk, smaller adds, or portfolio-level de-risking. They are not a replacement for MAJOR / RADAR confirmations.
• Non-XRP charts are context-only. Use optional non-XRP RISK triangles as broad market caution, not as asset-specific top/bottom calls.

Mind-Set & Beginner Safety Brief

- Emotions are the real opponent. Decide your size, risk, and exit ladder before clicking Buy. If a normal loss would disrupt your sleep, finances, or relationships, the position is too large or the plan is wrong.
- News is not an edge. By the time a headline feels obvious, the market often already priced in most of the move.
- Most first-year traders underestimate drawdowns, overestimate their emotional control, and trade too large. The result is usually unnecessary stress and avoidable damage.
- Avoid building your financial future around influencer calls, guru channels, or chat-room conviction. Sustainable edge comes from your own written process, not borrowed confidence.
- Do not treat trading as a rescue plan for today's bills. Education, savings, and low-stress compounding usually create much better long-run outcomes than pressure trading.
- Strategy overload is a hidden risk. Too many systems, too many symbols, and too many opinions create fatigue and mistakes. Master one ruleset before layering more complexity.
- If markets ever leave you feeling trapped, hopeless, or mentally overwhelmed, step away immediately and talk to someone you trust or a qualified professional. Money can be rebuilt; you cannot.
- Everything in trading is a building block. Past mistakes are tuition only if you stop repeating them.

Beginner lane: the cleanest way to start

- Use BITSTAMP:XRPUSD on the 1W chart.
- Leave defaults alone for at least one full learning cycle.
- Create only the essential alerts first: MAJOR TOP, RADAR TOP, and MAJOR BOTTOM.
- Treat RADAR BOTTOM, EARLY, LIGHT, and non-XRP RISK as optional until you understand the base workflow.
- Write your trim ladder and re-entry rules before the next signal arrives.

TradingView plan cheat-sheet

Question	Practical answer
Can every TradingView user load the script?	Invite-only access is granted by the author, not by the TradingView plan itself. Any account with permission can load the script on chart.
When do higher plans matter?	Higher plans matter mainly if you want more active alerts, longer-running alerts, or automation/webhook-heavy workflows.
When do webhooks matter?	If you want automated order-routing through a bridge or execution stack, confirm that your current TradingView plan supports the webhook workflow you intend to use.
Best advice	Choose the smallest TradingView plan that supports your actual alert workload. Do not over-buy a subscription before your workflow is stable.

Plan names, alert limits, and webhook availability can change over time. Treat this section as practical guidance and confirm current TradingView plan details before buying a subscription solely for automation.

Five-minute setup

1. Purchase access on the access page, provide the correct TradingView username, and wait for invite-only access to be granted.
2. Open TradingView and confirm that the script appears under Invite-only scripts on the account that received access.
3. Load a weekly XRP chart. BITSTAMP:XRPUSD is a common standard because of its long and clean history, but any liquid XRPUSD / XRPUSDT chart can be used for monitoring.
4. Use regular candles. Avoid Heikin-Ashi, Renko, or synthetic chart types for signal interpretation.
5. Turn on log scale if you prefer multi-year visual compression. The indicator logic itself is not changed by the visual scale.
6. Add the indicator, keep defaults, and create the alerts that match your chosen playbook.

Official operating model

This is the default customer workflow for v1.1.0 on BITSTAMP:XRPUSD on the 1W chart and the cleanest starting point for most customers: build from confirmed bottoms, manage risk as the cycle matures, and complete the managed exit only after the top-side sequence has fully played out.

How to use it well

Think in sleeves, not identity trades. Keep the trim ladder written in advance. MAJOR BOTTOM anchors the cycle sleeve, RADAR BOTTOM stays optional, RISK / HIGH RISK manages exposure, RADAR TOP often handles the practical de-risking, and MAJOR TOP completes the managed cycle exit.

Step	Signal	Typical action	Use it well
1	MAJOR	Build or restore the managed cycle sleeve.	Treat this as the anchor event for the sleeve, not a

	BOTTOM		prediction contest.
2	RADAR BOTTOM (optional)	Add only if cash was reserved and the written playbook allows it.	Optional means optional. Do not force extra size just because a label appeared.
3	RISK / HIGH RISK	First trim or tighter risk posture.	Use it as a management event. Reduce exposure or tighten discipline, but do not confuse caution with the final exit.
4	RADAR TOP	Primary top-side de-risk event; often the practical cycle top.	Keep RADAR TOP active alongside MAJOR TOP. Extended runs can confirm in stages.
5	MAJOR TOP	Finish the managed cycle exit and wait for the next bottom regime.	Think completion, not drama. The goal is a calm reset, not a heroic exact-tick sale.

Figure: Default v1.1.0 operating model for the managed cycle sleeve.

Weekly operating rhythm

A calm weekly rhythm is one of the biggest practical edges customers gain from the indicator. Keep the alerts live, review only on the weekly close, follow the written ladder, then log the action and reset for the next week.

Normal vs problem

Normal: long quiet periods, no new labels for weeks, EARLY changing intrabar, and optional layers staying silent.
Problem: wrong timeframe, wrong alert trigger, synthetic candles, missing invite-only access, or a live health banner warning of degraded data.

Step	Do this	Why it matters
1	**Keep the core alerts live.**	MAJOR TOP, RADAR TOP, and MAJOR BOTTOM are the non-negotiable stack. Add RADAR BOTTOM or RISK only if your written playbook uses them.
2	**Review only on the weekly close.**	Open BITSTAMP:XRPUSD on 1W, confirm the chart basis, check the label type, and ignore lower-timeframe noise that conflicts with the weekly regime.

3	**Follow the written ladder.**	Build, hold, trim, or exit exactly as the playbook says. The point is to remove improvisation when price feels scary or exciting.
4	**Log the action and reset.**	Screenshot the chart, record the action, update remaining size, and leave the alert stack ready for the next regime change.

Figure: The intended weekly operating rhythm for day-to-day customer use.

First-day checklist

- Do I understand that the indicator is weekly by design?
- Do I know which outputs are confirmations and which are only context?
- Do I have my top-side alerts live before the next cycle high arrives?
- Do I have a written exposure ladder for trims, adds, and exits?
- Am I using spot-size risk that I can tolerate emotionally and financially?

3. Installation and first-chart setup

Invite-only indicators are access-controlled. In practice, the workflow is simple: purchase access, provide the correct TradingView username, wait for access to be granted, then load the script from the Invite-only scripts section on the same account. For a new customer, the best first chart is BITSTAMP:XRPUSD on the 1W timeframe.

Recommended chart standard

- Symbol: BITSTAMP:XRPUSD (canonical XRP signal host).
- Timeframe: 1W.
- Chart type: regular candles.
- Scale: log scale is recommended for long-cycle visual inspection, but the indicator's outputs remain tied to the signal logic rather than the visual axis.

Practical setup sequence

1. Log in to the TradingView account that received invite-only access.
2. Open BITSTAMP:XRPUSD and switch to 1W.
3. Add the indicator from Invite-only scripts.
4. Leave the v1.1.0 defaults intact unless you already know why you want a different behavior.
5. Create alerts before you worry about visual tuning. The alerts matter more than the colors.
6. Save the chart layout once everything is live.

What good first-time behavior looks like

A good first-time customer setup is boring in the best way: 1W chart, default settings, core alerts live, and a written playbook for what to do when those alerts arrive.

The point is not to touch every setting. The point is to be ready before the next major cycle event.

What not to do on day one

- Do not start by optimizing a dozen settings against history.
- Do not expect the indicator to become a lower-timeframe scalp system by changing visuals.
- Do not turn every optional output on and then treat them all as equally important.
- Do not wait until a euphoric move to set the top alerts.

4. Signal scope, legend, and operating rules

Start with scope. This section tells you what can print, where it can print, and how seriously to take each output so your alerts, actions, and expectations stay aligned.

Signal / output	Scope	Timing	Typical use
MAJOR TOP	XRP only	Weekly close	Primary top confirmation and primary exit anchor.
RADAR TOP	XRP only	Weekly close	Complementary top confirmation. Can be the practical top call in extended topping runs. Keep it ON alongside MAJOR TOP.
MAJOR BOTTOM	XRP only	Weekly close	Primary bottom confirmation and cleanest long-side cycle anchor.
RADAR BOTTOM	XRP only	Weekly close	Optional secondary bottom-side confirmation. Best used as an add, earlier tactical re-risk, or advanced bottom-side confirmation.
EARLY TOP / BOTTOM	XRP only	Intra-week	Temporary heads-up layer for advanced users. It can resolve into a final confirmation or disappear at close.
LIGHT TOP / BOTTOM	XRP only	Weekly close	Context-only timing aid for local exhaustion or base-building, not a macro-cycle confirmation.
RISK / HIGH RISK (XRP)	XRP only	Weekly close	Serious caution layer for trims, tighter rules, and risk reduction while awaiting or surrounding top-side confirmations.
RISK / HIGH RISK (non-XRP)	Optional on non-XRP crypto charts	Weekly close	Educational macro caution overlay only. Not a standalone trading strategy and not an asset-specific top/bottom model.
Risk-colored XRP price line	XRP 1W only	Weekly close	Visual regime context between labels; does not generate signals or alerts.

Scope reminder
XRP is the only chart type that prints the full top/bottom workflow. Non-XRP charts are context-only via optional RISK / HIGH RISK triangles.
Treat non-XRP RISK as broad market caution, not as an asset-specific top/bottom engine.

Operating rules

- Timeframe: 1W. Confirmations are designed for the weekly close.
- EARLY labels are transient by design. Historical charts retain final confirmed labels, not every temporary intrabar heads-up.
- LIGHT helps timing and local structure. RISK / HIGH RISK are serious caution markers. MAJOR and RADAR remain the confirmation layer.
- Visual settings such as palette, tint, label distance, and line width do not change signals.
- Feature toggles that enable or suppress a class of labels can change what appears historically under those settings.
- The health banner and 1W reminder are visual-only operational aids that can flag timeframe, chart-basis, or degraded-data issues.
- On non-XRP charts, the workflow is context-only: optional RISK triangles, no XRP-style top/bottom confirmations.

Signals at a glance - confirmation versus speed

Layer	Speed	Reliability role	Best use
MAJOR	Slowest	Primary anchor	Investors and confirmation-first users.
RADAR	Fast enough to matter	Complementary confirmation	Top-side trims and optional bottom-side adds.
EARLY	Fastest	Heads-up only	Advanced users who intentionally want earlier information.
LIGHT	Moderate	Context only	Weekly timing nuance, not the main cycle call.
RISK / HIGH RISK	Moderate	Caution layer	Trim, tighten, reduce leverage, smaller adds.

5. Alert setup guide

Must-read alert rule

Create alerts on the 1W chart and use the script's named conditions. The signal type determines the correct trigger frequency.

Alert trigger guide

Condition	Use this trigger	Why
MAJOR TOP	Once Per Bar Close	Confirmed weekly close signal.
RADAR TOP	Once Per Bar Close	Confirmed weekly close signal. Keep active alongside MAJOR TOP.
MAJOR BOTTOM	Once Per Bar Close	Confirmed weekly close signal.
RADAR BOTTOM	Once Per Bar Close	Confirmed weekly close signal.
EARLY TOP / EARLY BOTTOM	Once Per Bar	For heads-up behavior during the week. Once Per Minute is optional only if you want repeated pings.
LIGHT TOP / LIGHT BOTTOM	Once Per Bar Close	Weekly-close context cue.
RISK (XRP) / RISK (non-XRP)	Once Per Bar Close	Weekly-close caution layer.

Recommended alert set by default

- Set alerts on the 1W chart. This is the single most important setup rule.
- Create the top-side pair together: MAJOR TOP and RADAR TOP. The first one that confirms at weekly close is your top-side call.
- Create MAJOR BOTTOM as the bottom-side anchor. Add RADAR BOTTOM only if your playbook includes optional adds or earlier tactical re-risking.
- Use EARLY only if you deliberately want a faster, less-stable heads-up layer. Beginners do not need it.
- Use LIGHT only if you want extra context around local exhaustion or base formation. It is OFF by default for a cleaner base workflow.
- Use non-XRP RISK only as macro context when scanning other crypto charts. Do not treat it like a standalone entry/exit system.

Alert naming convention

- Keep names literal and consistent: XRP MAJOR TOP 1W, XRP RADAR TOP 1W, XRP MAJOR BOTTOM 1W, XRP RISK 1W.
- If you automate, include symbol and timeframe in every alert name.

- If you run multiple playbooks, add the sleeve or strategy name to the alert name.

Common alert mistakes

- Wrong timeframe: if the chart is not 1W, the workflow is off-label.
- Expecting XRP-style tops or bottoms on non-XRP charts.
- Using synthetic candles that distort structure and wick behavior.
- Changing multiple settings and then judging historical output without realizing you changed signal eligibility.
- Forgetting that EARLY can disappear at close by design.
- Ignoring the health banner when degraded data conditions are flagged.
- Assuming a RISK triangle means market top now instead of de-risk, tighten, and wait for confirmation discipline.

Manual versus automation

Execution path	Pros	Trade-offs
Manual execution	Maximum discretion, no external bridge risk, simplest for beginners.	Requires attention, slower response, and more emotional discipline.
Webhook bridge / auto-routing	Fast and repeatable once mapped correctly. Useful for users managing many alerts or wanting 24/7 routing.	Requires testing, fail-safes, and careful handling of third-party bridge risk, latency, and mapping errors.

Webhook safety

- Paper trade or sandbox the full route before sending live orders.
- Use explicit max-exposure limits, order-size caps, and a manual kill switch.
- Do not place passwords, logins, or other sensitive credentials inside alert messages or URLs.
- Monitor for duplicate, delayed, or failed bridge events. Automation lowers emotion but adds operational risk.

Practical note: keep MAJOR TOP and RADAR TOP active together. For most users, that pair is the most important alert stack in the entire workflow.

6. Strategy playbooks for investors, hybrids, and active traders

Most customer mistakes happen after a signal appears: the label is visible, but the action is undefined. This section turns each important output into a written exposure decision so the indicator can be used with consistency instead of improvisation.

Playbook	Best for	Core rule	Typical trade-off
MAJOR-Only Cycle Investor	Lowest-maintenance long-term users	MAJOR BOTTOM in, MAJOR TOP out; use RADAR / RISK as awareness only.	Simplest workflow, but more give-back near tops.
Core + Trim Ladder (recommended default)	Most customers	MAJOR BOTTOM anchor; optional RADAR BOTTOM adds; de-risk with RISK, distribute with RADAR TOP, finish at MAJOR TOP.	Best balance of participation and downside control; requires a written trim ladder.
Hybrid Confirmation-First	Users who want adds but still dislike EARLY noise	MAJOR BOTTOM anchor plus selective RADAR BOTTOM adds if still under-allocated; keep MAJOR and RADAR TOP active together.	More decisions than MAJOR-Only, but still strongly confirmation-led.
Profit-Protection / Defensive Trader	Users who care most about drawdown and preserving gains	Use RISK as the earliest trim layer and treat RADAR TOP as a strong exit cue even if MAJOR TOP has not printed yet.	May leave upside on the table if the market extends after a trim.
Weekly-Bias Trader	Lower-timeframe traders who want a macro filter	Use weekly MAJOR / RADAR / RISK as directional bias, then execute separately on your lower timeframe in the same direction.	Best for advanced users who already have an execution method.

Action matrix by signal type

Signal	Investor	Hybrid	Trader / defensive
MAJOR BOTTOM	Build or restore full planned cycle allocation.	Build or restore core / swing allocation.	Bias flips risk-on; larger swing entries allowed.
RADAR BOTTOM	Usually ignore or treat as optional add only if under-allocated.	Optional add or tactical re-risk if the base plan allows it.	Can be used as tactical add or earlier confirmation inside a broader long bias.
RISK / HIGH RISK	Awareness only or small trim if you prefer lower volatility.	Trim a defined portion, tighten rules, reduce leverage to zero, stop oversizing new adds.	Active de-risk layer. Cut size faster and refuse low-quality fresh longs.

RADAR TOP	Use if you prefer to reduce give-back; otherwise note it and wait for MAJOR TOP.	Primary trim zone. Many users cut to a partial position here.	Often a practical exit signal, especially in defensive or tactical workflows.
MAJOR TOP	Primary full exit for the cycle sleeve.	Finish distribution or reduce to only the intentionally untouched long-term core.	Hard confirmation that the weekly cycle sleeve should be de-risked or flat.
EARLY / LIGHT	Not needed for the base investor workflow.	Optional planning aids only.	Useful only if the user already knows how to handle earlier, less final information.

Playbook A - MAJOR-Only Cycle Investor

Goal: Lowest maintenance and lowest decision count.

- Use BITSTAMP:XRPUSD on the 1W chart.
- On MAJOR BOTTOM: build to your full planned cycle allocation.
- Ignore RADAR BOTTOM unless you consciously decide to use it later as an optional add path.
- Hold through normal noise.
- On MAJOR TOP: exit the cycle allocation in full, or reduce back to only a separately designated long-term core.

Best for: Investors who want a clean long-term process and do not care about squeezing every last percentage point.

Watch-out: You will usually give back more near tops than users who actively use RISK and RADAR TOP.

Playbook B - Core + Trim Ladder (recommended)

Goal: Best overall balance for most customers.

- Define a cycle sleeve that this playbook will manage. Keep any true long-term untouched core separate if desired.
- On MAJOR BOTTOM: build or restore the cycle sleeve to full planned size.
- If RADAR BOTTOM prints later and you are still under-allocated, add only the amount you already pre-approved.
- On the first RISK or HIGH RISK print: trim a prewritten portion, such as 10% to 25% of the cycle sleeve.
- On RADAR TOP: distribute a larger portion, such as cutting to 25% to 50% of the cycle sleeve.
- On MAJOR TOP: complete the cycle exit for the managed sleeve.

Best for: Most users, because it protects gains earlier without abandoning the structure of the weekly confirmation system.

Watch-out: The ladder must be written in advance. Without preset trim sizes, RISK and RADAR TOP become emotional decisions.

Playbook C - Hybrid Confirmation-First

Goal: Let confirmed bottoms do the heavy lifting while still using the extra bottom path when it genuinely helps.

- Use MAJOR BOTTOM as the main buy anchor.

- Turn RADAR BOTTOM ON and use it only when you intentionally missed size, still have cash allocated to the cycle sleeve, or want an additional confirmation path for a developing bottom.
- Keep RISK, RADAR TOP, and MAJOR TOP active for the distribution ladder.
- Ignore EARLY and LIGHT unless you are already comfortable with the base system.

Best for: Users who want confirmed bottoms to do most of the heavy lifting while keeping RADAR BOTTOM available as an intentional add path.

Watch-out: Do not turn RADAR BOTTOM into an excuse for over-trading every wobble.

Playbook D - Profit Protection / Defensive Trader

Goal: Prioritize drawdown control and preservation of large cycle gains.

- Use MAJOR BOTTOM or MAJOR BOTTOM plus selective RADAR BOTTOM adds for entries.
- Treat the first RISK / HIGH RISK print as an active management event, not background decoration.
- Trim sooner and more aggressively than the balanced playbook.
- Treat RADAR TOP as a potential practical exit rather than just a partial trim if your style values downside control over full upside capture.
- Use MAJOR TOP as the final confirmation if you still hold any tactical size.

Best for: Users who care more about keeping large gains than about catching every final extension.

Watch-out: This profile can underperform in runaway blow-off phases because it sells earlier by design.

Playbook E - Weekly-Bias Trader

Goal: Use the indicator as a higher-timeframe filter rather than as the exact execution method.

- Use MAJOR BOTTOM, RADAR BOTTOM, RISK, RADAR TOP, and MAJOR TOP to define the weekly bias.
- Only take lower-timeframe trades that agree with that weekly bias.
- After a confirmed top-side signal, stop forcing aggressive long continuation trades until the weekly structure resets.
- Keep execution separate: the indicator defines direction and regime, not your micro-entry mechanics.

Best for: Experienced traders who already have an entry / exit process and need a macro filter.

Watch-out: This is an advanced path. It does not reduce the need for a separate execution system.

What is the best overall strategy for most customers?
• For most users, the best default is the Core + Trim Ladder. It is disciplined enough for investors, active enough for hybrids, and much easier to follow than a fully discretionary DIY cycle process.
• For pure long-term investors who want the fewest decisions, MAJOR-Only remains the cleanest operating model.
• For users who hate large give-back after massive rallies, the defensive profile that treats RISK and RADAR TOP more aggressively is usually the better emotional and practical fit.
• RADAR BOTTOM should stay optional. It can improve capital deployment for hybrids, but it should not become an excuse to turn the indicator into a high-frequency bottom-fishing habit.

The cleanest way to reduce emotional over-trading is to separate capital by role. A true long-term core can stay untouched, the cycle sleeve follows the indicator's playbooks, and any tactical reserve should only exist if its add rules are already written down.

Why sleeves matter

Mixing all capital into one mental bucket is how good signals turn into emotional over-trading. A separate core keeps long-term investors calm, a dedicated cycle sleeve lets the indicator do its job, and a tactical reserve only exists if the add rules are prewritten.

Sleeve	Role	Use	Discipline note
Long-term core	Untouched exposure for investors who never want the indicator to flatten all long-term holdings.	OPTIONAL	Keep it separate from the managed cycle sleeve. Do not react to every signal with the core.
Cycle sleeve	The main sleeve managed by MAJOR BOTTOM, RISK / HIGH RISK, RADAR TOP, and MAJOR TOP.	RECOMMENDED	This is where the indicator usually creates the most value. Write the trim ladder before the cycle heats up.
Tactical reserve	Cash or dry powder reserved for RADAR BOTTOM adds, defensive re-entry, or future cycle resets.	OPTIONAL	Only useful if the size and conditions are written in advance. Without rules it becomes emotional cash drift.

Figure: A simple sleeve structure that keeps long-term holdings, the managed cycle sleeve, and any optional reserve from bleeding into one another.

Quick tweaks

Situation	Suggested change
I want fewer moving parts	Ignore EARLY and LIGHT. Use MAJOR BOTTOM, RADAR TOP, and MAJOR TOP only.
I want more downside protection	Use RISK as an active trim layer and treat RADAR TOP as a stronger de-risking event.
I missed the MAJOR BOTTOM	Do not chase blindly. Use a smaller staged plan or wait for a preapproved RADAR BOTTOM add if your workflow includes it.
I want earlier information	Use EARLY intentionally, knowing it can disappear by close. This is an advanced choice, not a default necessity.
I want cleaner charts	Keep LIGHT OFF and avoid turning on optional layers you do not actively use.

Single-sentence playbook

Build at MAJOR BOTTOM, optionally add at RADAR BOTTOM if still under-allocated, reduce on RISK / HIGH RISK, distribute on RADAR TOP, and finish the cycle sleeve on MAJOR TOP - all on the weekly close.

7. Risk management and workflow discipline

The signal engine provides structure. Risk management determines whether that structure translates into durable results. This section turns the weekly signal stack into a practical operating process: layered positioning, staged accumulation, cost awareness, and a workflow that helps users stay disciplined when markets become emotional.

Layered positioning

Bucket	Role
Long-term core	Optional bucket that is intentionally not managed by every tactical signal. Use this only if you consciously want permanent exposure.
Cycle sleeve	The main allocation managed by this documentation's playbooks. This is where MAJOR BOTTOM, RADAR BOTTOM, RISK, RADAR TOP, and MAJOR TOP do their work.
Active / trader sleeve	Optional smaller bucket for users who already run a separate execution strategy and only want the indicator as a macro filter.

DCA first, stops optional - with nuance

Weekly-cycle trading often benefits more from staged spot positioning than from extremely tight hard stops. XRP can produce violent wicks that eject tight stops even when the higher-timeframe regime is unchanged. That does not mean stops are wrong. It means the stop logic must match the timeframe, size, and purpose of the trade. For many users, a well-defined position size, staged adds, and a written trim ladder matter more than ultra-tight mechanical stops inside a weekly-cycle system.

Risk management principles

Principle	Implementation
Segregate capital	Separate a true long-term core from the cycle sleeve if you want to keep both. Do not blur them in the heat of the moment.
Pre-map adds and trims	Write your bottom-side add sizes and top-side trim sizes before signals arrive.
Journal the decision	Record the signal, size, reason, and emotion. This is how users learn whether they are following the system or improvising around it.
Cap emotional risk	If the position is large enough to distort your thinking, the

	position is too large.
Reduce complexity	Use spot before leverage, one process before ten, and repeatable rules before hot takes.

Pre-trade checklist

☐ Am I on the 1W timeframe, and is the signal type being used correctly?

☐ Do I understand whether this is a confirmation, a heads-up, or a context-only marker?

☐ Is the size inside my pre-set exposure cap for this sleeve?

☐ Do I already know what I will do if price extends, stalls, or reverses?

☐ Have I accounted for fees, slippage, taxes, and venue differences?

☐ Is my stress level low enough that I can follow the written plan without improvising?

High-risk trading to avoid

Behavior	Why it hurts	Safer path
High leverage / margin	Magnifies both timing errors and emotional errors. Late-cycle volatility can erase an account faster than a good signal can save it.	Spot positions sized for realistic weekly drawdowns.
Shorting blow-off crypto conditions	Losses are theoretically unlimited and squeezes are vicious.	Use top-side confirmations to distribute or go flat rather than trying to short every spike.
Options or exotic derivatives before mastering the base system	Time decay, hidden leverage, and complex Greeks can overwhelm the signal edge.	Master the spot workflow first.
Strategy overload	Too many systems lead to fatigue, contradiction, and poor execution.	Run one primary playbook well.
Revenge sizing after a big win or loss	Emotion contaminates position size faster than it contaminates chart reading.	Keep fixed risk buckets and preapproved ladders.

Hidden costs and the spot-first discipline

- Commissions, spreads, and slippage.
- Funding, margin interest, and liquidation penalties if you use derivatives.
- Withdrawal, transfer, and FX friction between venues.
- Taxes and record-keeping burden.
- Opportunity cost from impulsive chasing after missing a signal.

For many users, a spot-first workflow is the cleanest way to let a weekly edge matter. Hidden carrying costs can ruin good timing.

Directional-filter workflow

1. Identify the current weekly regime on XRP: bottom-side confirmed, top-side caution, or top-side confirmed.
2. Set the macro stance for the cycle sleeve: build, hold, trim, or stand aside.
3. If you also trade lower timeframes, only take trades that agree with that weekly stance.
4. If non-XRP RISK is elevated, reduce the size and aggressiveness of fresh alt exposure.
5. Return to the written ladder. The weekly signal defines the bias; your process defines the exact implementation.

Weekly operating rhythm
- Weekly review: check whether any new MAJOR, RADAR, RISK, or LIGHT event confirmed at the close.
- Bias log: write the current weekly stance in one sentence.
- Plan update: confirm your next add, trim, and exit levels before the next week begins.
- Session planning: if you also trade lower timeframes, map only the setups that agree with the weekly bias.
- Execution: only change exposure for reasons that already exist in the written playbook.
- Post-action note: capture screenshots and the reason for every size change.

8. Settings guide - v1.1.0 defaults, profile presets, and operating mode

Setting	Default	Affects signals?	Practical note
Soft-confirm filter	ON	Signal-affecting	Recommended ON for cleaner weekly confirmation behavior.
RADAR top (XRP)	ON	Signal-affecting	Keep ON. It matters for top calls.
RADAR bottom (XRP)	ON	Signal-affecting	Default ON in v1.1.0. Treat as optional tactically, not mandatory behavior.
Signal sensitivity (spacing)	1	Signal-affecting	Default spacing for repeated labels.
LIGHT TOP / BOTTOM	OFF	Signal-affecting	Context only. OFF by default for a cleaner base workflow.
Risk - XRP	Risk + High Risk	Signal-affecting	Serious trim / tighten context. Recommended ON.
Risk filter - XRP	Ultra	Signal-affecting	Most selective default.
Risk - non-XRP	Off	Signal-affecting	Optional macro context only.
Risk filter - non-XRP	Ultra	Signal-affecting	Default if you choose to enable non-XRP risk.
Risk-colored XRP price line	ON	Visual-only	Useful context between signals; does not change alerts.
Risk color aggressiveness	0.5	Visual-only	v1.1.0 default visual contrast.
Show MAJOR labels	ON	Visual-only	Hides or shows MAJOR labels without changing alerts.
Label distance / tint / palette / reminder / health labels	As shipped	Mostly visual-only	Change only for readability and preference.

Profile presets

Profile	Recommended setup
Investor (simple)	Soft-confirm ON; RADAR Top ON; MAJOR BOTTOM / MAJOR TOP core alerts; LIGHT OFF; RISK optional awareness only.

Hybrid (recommended)	Soft-confirm ON; RADAR Top ON; RADAR Bottom ON; LIGHT OFF; RISK on XRP ON; use trim ladder.
Defensive trader	Same as Hybrid, but actively use RISK and treat RADAR TOP as a strong distribution cue.
Weekly-bias trader	Use the hybrid signal stack for macro direction, then apply your own separate lower-timeframe execution.

What changes signals and what is visual only?

Category	Examples
Changes what can print	Soft-confirm, RADAR Bottom toggle, RADAR Top toggle, LIGHT toggle, risk toggles and filters, signal sensitivity.
Does not change the signal logic	Label distance, tint opacity, palette, line width, risk color aggressiveness, major-label visibility, reminder banners.

Operating mode and defaults at a glance

Topic	Guidance
Operating mode	Run the script on BITSTAMP:XRPUSD on the 1W chart, leave defaults intact until you have a written reason to change them, and create alerts before spending time on visual tuning.
Top-side discipline	Keep MAJOR TOP and RADAR TOP active together. The first confirmed top-side print at the weekly close is the practical call.
Bottom-side discipline	MAJOR BOTTOM is the clean base anchor. RADAR BOTTOM stays optional for under-allocation, late adds, or a confirmation-first hybrid workflow.
Context layers	LIGHT is optional timing context. RISK / HIGH RISK are serious trim / tighten cues. Non-XRP RISK is macro context only.

9. Troubleshooting and FAQ

Fast troubleshooting

- If alerts are not firing, confirm that you created the alert on BITSTAMP:XRPUSD on the 1W chart, using the indicator's named condition and the correct trigger frequency for that signal type.
- If the Invite-only scripts tab is missing, confirm that access has been granted to the exact TradingView username you are using.
- If labels look odd, confirm BITSTAMP:XRPUSD, regular candles, and the intended settings.
- If you see the health banner, treat it as an operational pause or caution state, not as a hidden signal.
- If a signal class appears missing from history, confirm that its toggle is enabled and that your current settings match the settings you think you are reviewing.

Platform banners and expected behavior

- The generic TradingView caution banners around log scale or repainting are platform notices, not proof that the confirmed weekly outputs are broken.
- EARLY is allowed to change until the weekly close by design. Confirmed weekly-close outputs are the stable record.
- TradingView alerts are server-side. That means they can continue working even when your browser or app is not open, provided the alert is live on their servers.

Frequently asked questions

I only day-trade. Why should I care about a weekly signal?

Because the weekly signal defines the tide. It helps you avoid fighting the larger cycle, reduces over-trading, and can improve selectivity even if your actual entries happen on lower timeframes.

Does the indicator repaint?

Confirmed weekly-close labels are anchored to the weekly close. EARLY is the exception by design: it is a heads-up layer that can disappear if weekly conditions do not confirm.

Do I need anything beyond the labels, alerts, and written playbook?

No. For most customers, the indicator is meant to be used through its labels, alerts, and weekly playbook rather than a complicated workflow.

Can I use it on lower timeframes?

No. The indicator is designed around the 1-week chart, and canonical XRP signals should be run on BITSTAMP:XRPUSD. Lower-timeframe use is off-label and other XRP venues are not the canonical signal host.

What if I miss a MAJOR BOTTOM?

Do not turn one missed entry into emotional chasing. Either use a smaller staged plan, wait for a valid optional RADAR BOTTOM add if your playbook includes it, or accept the miss and wait for the next high-quality cycle opportunity.

What is the difference between MAJOR and RADAR?

Both are weekly-close confirmations. MAJOR is the primary anchor. RADAR is the complementary path, especially important on the top side because it can be the practical top call in extended topping structures.

Should trading with this indicator feel stressful?

No. If it does, your size is probably too large, your plan is unclear, or you are using the wrong playbook for your temperament.

Will I keep paying AZRO after purchase?

Review the access page for the billing, update, fulfillment, and refund terms that apply to your purchase.

How long does access usually take?

Invite-only access is manually granted to the TradingView account that receives permission. If access takes materially longer than expected, contact support with the exact TradingView username used for purchase.

Can I share the script?

No. Access is personal, invite-only, and tied to the TradingView account that received permission.

Where do I get help?

Email support@azrosystems.com and include your TradingView username, chart symbol, timeframe, settings screenshot, and a description of the issue.

10. Validation, performance, and robustness

A strong performance section should help customers judge robustness, not sell a fantasy. For that reason, this pack uses a two-layer validation philosophy. First, it evaluates whether the output stack is operationally coherent: weekly-close confirmations, tactical caution layers, and a cleaner trigger guide. Second, it compares rule families so customers can see how different playbook styles trade off upside capture, drawdown control, and complexity.

- Judge the indicator by repeatability, not by one perfect historical number.
- Bar-close discipline matters more than cherry-picked intrabar fills.
- Fees, slippage, venue differences, and delayed human execution all matter.
- A useful model should still make sense when you test it under less-than-perfect execution assumptions.

Backtest methodology checklist

Item	Good practice
Chart basis	Weekly XRP chart using the current customer workflow and named signal classes.
Execution assumption	Act at or after the confirmed weekly close for confirmation signals; use EARLY only if the playbook explicitly chooses it.
Cost model	Always include fees and slippage assumptions. Spot and derivative implementations should be evaluated separately.
Comparison set	Buy-and-hold, MAJOR-only, balanced trim ladder, and more defensive top-side playbooks.
Robustness checks	Delayed execution, alternate venues, different trim ladders, and sensitivity to missing one signal.

How to read common metrics

- CAGR tells you the long-run growth rate, but it is very sensitive to start and end points.
- Maximum drawdown tells you the pain you must survive.
- Sharpe can look muted for systems that spend part of the time in cash.
- Calmar is often more intuitive for cycle systems because it directly compares growth to drawdown.
- Trade count matters. Very small numbers of trades can make many ratios look cleaner than they will in real life.

Illustrative signal map

Figure: Example weekly XRP price with MAJOR, RADAR, and RISK markers.

Illustrative playbook comparison

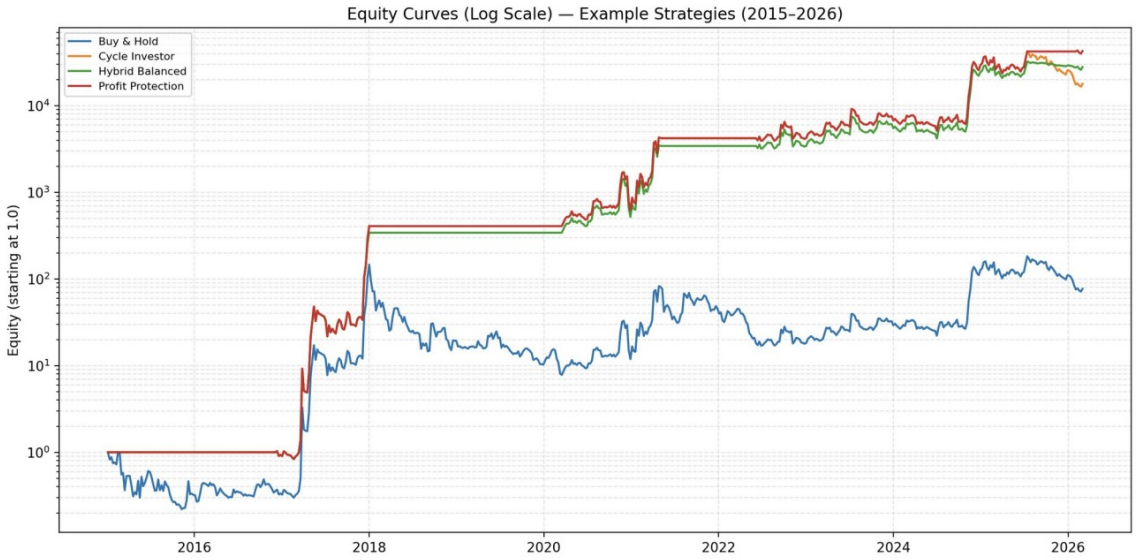

Figure: Illustrative equity curves comparing several rule families over the same historical window.

Strategy	Trades	Avg exposure	Final multiple	CAGR	Max DD	Sharpe	Calmar
Buy & Hold	1	1.00	77.3x	47.7%	-94.7%	0.70	0.50

Cycle Investor	5	0.53	17,842.0x	140.5%	-63.9%	0.83	2.20
Hybrid Balanced	10	0.48	27,901.8x	150.4%	-63.9%	0.84	2.35
Profit Protection	7	0.48	42,782.0x	160.1%	-63.9%	0.87	2.51

The comparison table and charts in this section are illustrative playbook comparisons rather than an audited promise of live results. Their value is comparative: they show how the different rule families behave against one another over the same historical window. Customers should treat them as scenario analysis, then retest using their own venue, fee, and implementation assumptions.

Why many customers may trust this more than pure DIY discretion

• The indicator removes a large amount of discretionary noise by forcing decisions onto a weekly cadence instead of the constant emotional churn of lower-timeframe chart watching.

• It distinguishes between confirmations and context. Many DIY traders blur those two ideas and end up acting too hard on weak information.

• It is built to support a full operating workflow: chart setup, alerting, trimming, adding, and post-signal discipline - not just a label on a chart.

• Its practical edge is less about magical prediction and more about consistent execution, selective timing, and avoiding the most common emotional mistakes.

Illustrative event study snapshot

An event-study view helps answer a practical customer question: what has typically happened after the indicator printed a given class of signal? This figure is illustrative, but it strengthens the performance section by comparing forward outcomes by signal type rather than relying on a single compounded equity curve.

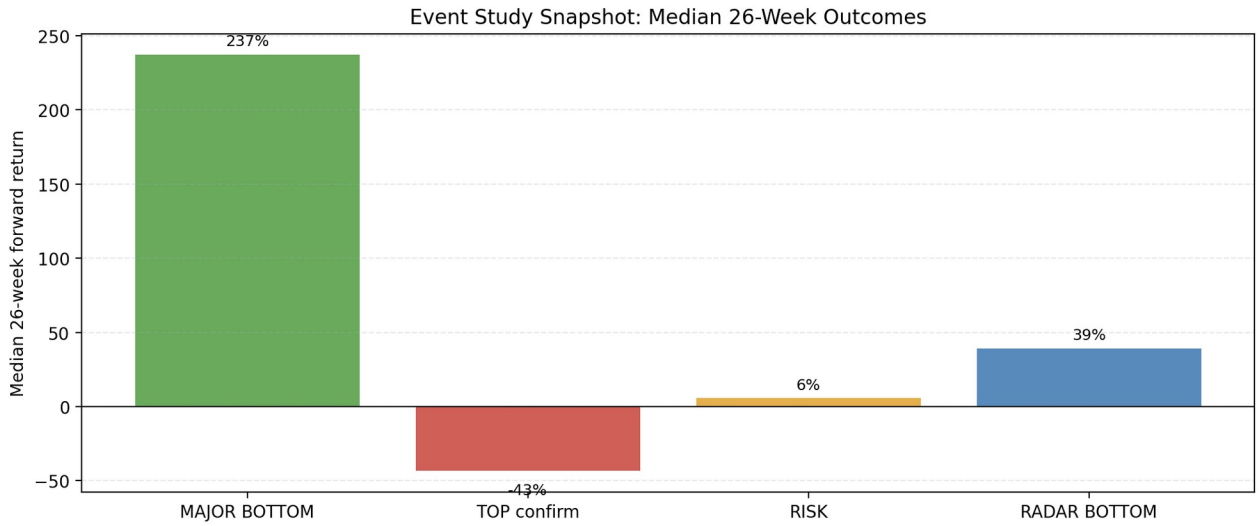

Figure: Median 26-week forward outcomes following selected signal classes over the test window.

Illustrative trim-ladder efficiency map

This view helps compare how much exposure different rule ladders require relative to their growth and drawdown efficiency. It is useful for customers deciding how aggressive or conservative they want their trim ladder to be.

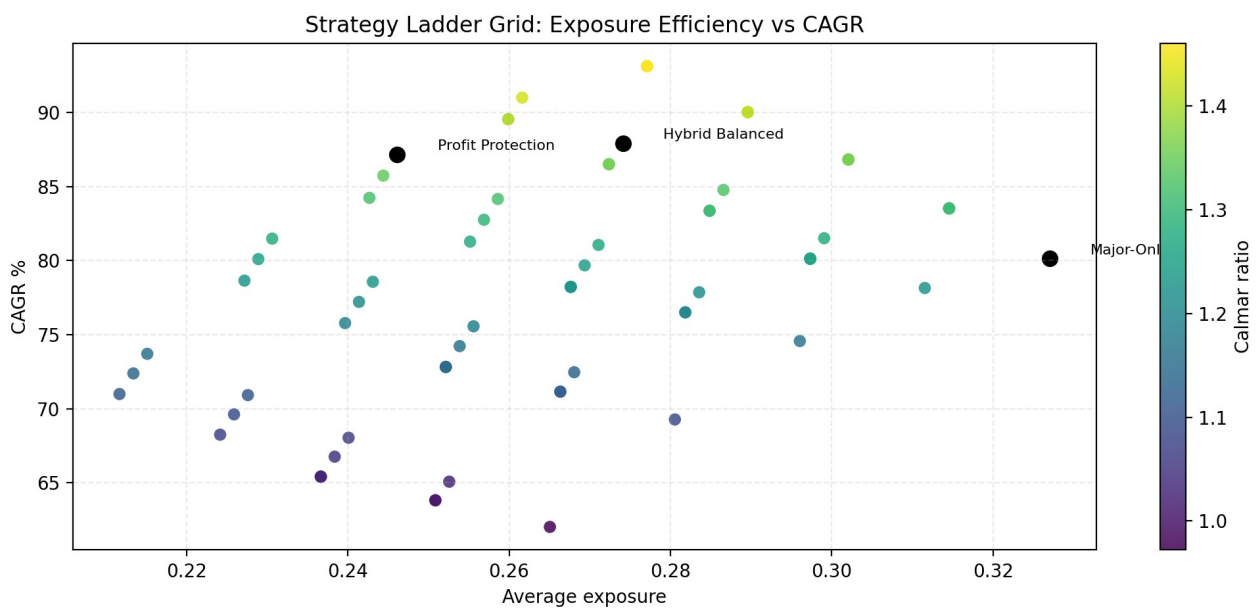

Figure: Trim-ladder efficiency map comparing average exposure, CAGR, and Calmar across rule variants. Highlighted markers show representative customer playbooks.

11. Resources, support, and TradingView help

Use the live links below for access, support, and TradingView help articles that matter most to real customers.

Will alerts work if TradingView is closed?	https://www.tradingview.com/support/solutions/43000548327-will-alerts-work-if-tradingview-is-not-open-on-the-computer/

Support request checklist

- Your TradingView username.
- The exact symbol and timeframe.
- A screenshot of the chart and settings.
- The name of the alert condition that did or did not fire.
- A short description of what you expected to happen.

12. Risk disclosure statement

- Digital-asset markets are volatile and can move with extreme speed. You can lose all or substantially all of your capital.
- Past performance, examples, historical behavior, or backtest snapshots do not guarantee future results.
- Backtests and hypothetical comparisons do not fully capture liquidity, slippage, taxes, psychology, infrastructure failure, or user configuration error.
- Leverage and derivatives can magnify losses. Many users are better served by spot-only implementation while learning.
- Trading rules, data sources, and platform behavior can be affected by outages, exchange disruptions, regulatory actions, or structural market shifts.
- Nothing in this pack, the indicator, or related communications is personalized financial, investment, legal, or tax advice.

13. Privacy policy

AZRO Systems may need limited customer information to fulfill access and support, such as name, email, TradingView username, and payment confirmation data supplied through the payment processor.

The purpose of collection is straightforward: fulfill access, maintain invite-only permissions, provide support, communicate material indicator updates, and comply with legal or payment obligations.

AZRO Systems does not take custody of exchange funds, does not trade customer accounts, and does not need access to balances or API keys in order to grant indicator access.

Customer information should not be sold. Third-party processors may handle payment, product delivery, chart access, or email delivery as part of normal operations.

If you contact support, the submitted screenshots, emails, and issue descriptions may be retained as needed to resolve the issue, maintain service records, and enforce agreements.

Customers should review the current product page and payment processor terms for the latest billing and privacy details.

Privacy contact

For privacy questions or customer-support issues, contact support@azrosystems.com.

14. Terms of service summary

- Access is provided as an invite-only TradingView script tied to the TradingView account that receives permission.
- The customer receives a personal, non-transferable, revocable license to use the indicator for their own charting and analysis.
- You may not resell, sublicense, redistribute, or publish the script or documentation without permission.
- Access is personal and tied to the approved TradingView account. Sharing or reposting paid materials is not allowed.
- Billing, updates, refunds, and access fulfillment are governed by the current product/access page and the payment processor's policies. Review them carefully before purchase.
- Violation of the license terms can result in access revocation.

Practical note

The live product/access page and payment processor remain the right place to confirm the current billing, updates, refund, and fulfillment terms before purchase.

15. Master disclaimer and notices

Educational use only

The indicator, documentation, examples, and communications are provided for informational and educational use only. They are not recommendations, solicitations, or a promise of results.

No personalized advice

Nothing in the pack accounts for your objectives, financial situation, tax position, or legal constraints. You are responsible for suitability and for obtaining qualified professional advice where needed.

No custody and no trade execution

AZRO Systems provides software and documentation. It does not take custody of customer funds, direct customer accounts, or guarantee the behavior of any third-party bridge, broker, exchange, or charting platform.

Third-party platform risk

Signals, alerts, data, and automation may depend on TradingView, exchanges, webhooks, bridges, email delivery, mobile notification services, or other external services that can fail, change, or delay.

Hypothetical performance warning

Any example returns, charts, or strategy comparisons are hypothetical. They do not reflect actual customer accounts, and they may understate real-world friction or implementation error.

Warranty and liability

The indicator is provided as-is and as-available. To the maximum extent permitted by law, AZRO Systems is not liable for trading losses, missed trades, delayed alerts, opportunity costs, or damages resulting from platform issues, data issues, user configuration, or market events.

Intellectual property

The indicator, documentation, and brand materials remain the property of AZRO Systems. All rights not expressly granted are reserved.

End of pack.
