Alert triggers guide

What to alert on, how often, and what each alert is for (v1.0.9).

Recommended alert cadence and how to interpret each alert type.

Tip: Set alerts once, then focus on execution. Alerts should route you back to your plan - not to impulsive decisions.

MAJOR TOP / MAJOR BOTTOM Frequency: once per bar close
Core confirmations near extremes. Designed to be low-frequency and evaluated on the weekly close.

RADAR TOP / RADAR BOTTOM Frequency: once per bar close
Secondary track that can provide earlier context around developing conditions (still confirm on close).

EARLY TOP / EARLY BOTTOM Frequency: once per bar
Staging cues that can appear intra-week. They are not confirmations until the bar closes. Optional soft-confirm filtering can reduce transient prints.

LIGHT TOP / LIGHT BOTTOM Frequency: once per bar close
Heads-up labels intended to keep noise low. Treat as informational context, not as a directive.

RISK / HIGH-RISK triangles Frequency: once per bar close
Context overlay. Use to inform sizing and risk limits. Do not treat as a standalone “trade signal.”

Note: Alert availability (push/email/webhook) depends on your TradingView plan.
