BTC Operating System Quick Reference

Version v1.0.6

The base workflow in one sentence

Set the policy inputs, review ACTION and the suggested amount on the confirmed weekly close, compare the process with the auto-buy baseline, and record the week so chapter changes stay auditable.

Mode ladder

Mode	Use it for	Watch-out
Stack	Buy-only accumulation with the fewest moving parts.	You give up optional trim behavior.
Adaptive	Best overall default for most customers.	Still needs written trim and re-engagement discipline if you use the trim path.
Event	Cleaner attention around rarer major cycle windows.	Quieter between event weeks; do not expect constant activity.
Performance	Most assertive published BTC-eq posture in the current release.	Not for strict always-hold preferences and can move meaningfully into cash.

Correct alert paths

Alert / path	Trigger
Any alert() function call	Once Per Bar Close
Weekly Update	Once Per Bar Close

Alert / path	Trigger
Major Cycle Event	Once Per Bar Close

Status flags that matter

- SET TF: 1W -> the chart is not on the intended timeframe.
- SET SYMBOL: BTC or CHECK FEED -> use the supported BTC chart family, ideally INDEX:BTCUSD.
- START: FUTURE or DATA: LIMITED -> the current chapter cannot be evaluated cleanly yet.
- STATUS: SAFE persisting unexpectedly -> slow down and verify the chart, data, and current settings before acting.
