BTC Operating System
Customer Validation Pack

Version v1.0.0 • Updated 2026-03-06

Indicator: Invite-only TradingView indicator

Support: support@azrosystems.com

Customer documentation for the AZRO Systems weekly Bitcoin allocation indicator. Use this pack to install it cleanly, operate it calmly, and judge it against a simple auto-buy baseline without losing the discipline that makes the system valuable.

What this pack is

This validation pack summarizes the release-state customer metrics workbook and the broader walk-forward evidence that supports the public customer materials. It is designed to build trust in the operating process, the benchmark logic, and the release-state numbers without turning the customer document set into a research notebook.

Standardized example assumptions

BTCUSD on the 1W timeframe, Jan 2017 to Mar 2026, $50 per week, $1,000 cash buffer, 0.10% modeled one-way fees, pre-tax. The baseline is a fixed-schedule weekly BTC buy using the same cashflows while keeping the same $1,000 buffer.

Customer mode performance

Mode	Profile	BTC-eq	× baseline	End value	Trades
Stack	Conservative	3.75	1.40×	$258,587	287
Stack	Balanced	3.77	1.40×	$259,587	287
Stack	Aggressive (BTC-max)	3.81	1.42×	$262,915	291
Adaptive	Conservative	5.22	1.95×	$359,813	374
Adaptive	Balanced	5.62	2.09×	$387,138	383
Adaptive	Aggressive (BTC-max)	6.43	2.40×	$443,136	395
Event	Conservative	5.18	1.93×	$357,230	369
Event	Balanced	5.31	1.98×	$366,341	365
Event	Aggressive (BTC-max)	5.74	2.14×	$395,349	365
Performance	Managed preset	36.19	13.49×	$2,494,908	199

Mode-range summary

Mode family	Release-state range vs baseline	BTC-eq range	Comment

Stack	~1.40× to ~1.42×	3.75 to 3.81 BTC-eq	Most conservative; buys only.
Adaptive	~1.95× to ~2.40×	5.22 to 6.43 BTC-eq	Default family; balances continuity and responsiveness.
Event	~1.93× to ~2.14×	5.18 to 5.74 BTC-eq	More reactive around major cycle inflection weeks.
Performance	13.49×	36.19 BTC-eq	Managed preset for maximum BTC-eq in the release matrix; can shift meaningfully into cash.

Release-state figures

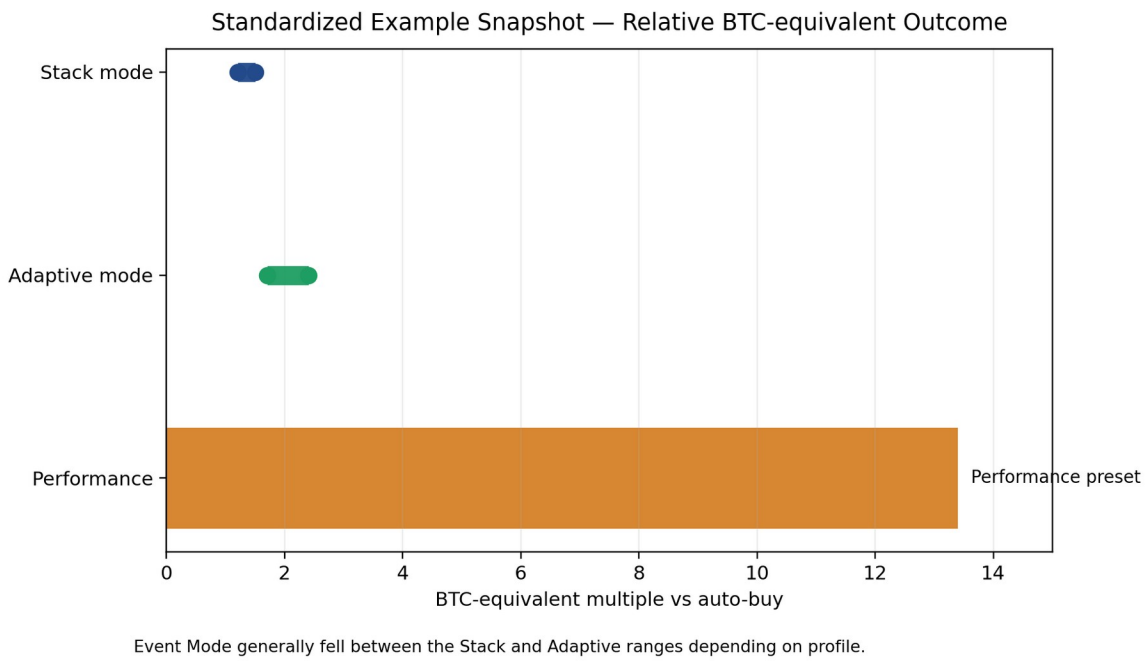

Figure: Relative BTC-equivalent outcome snapshot from the standardized example workbook.

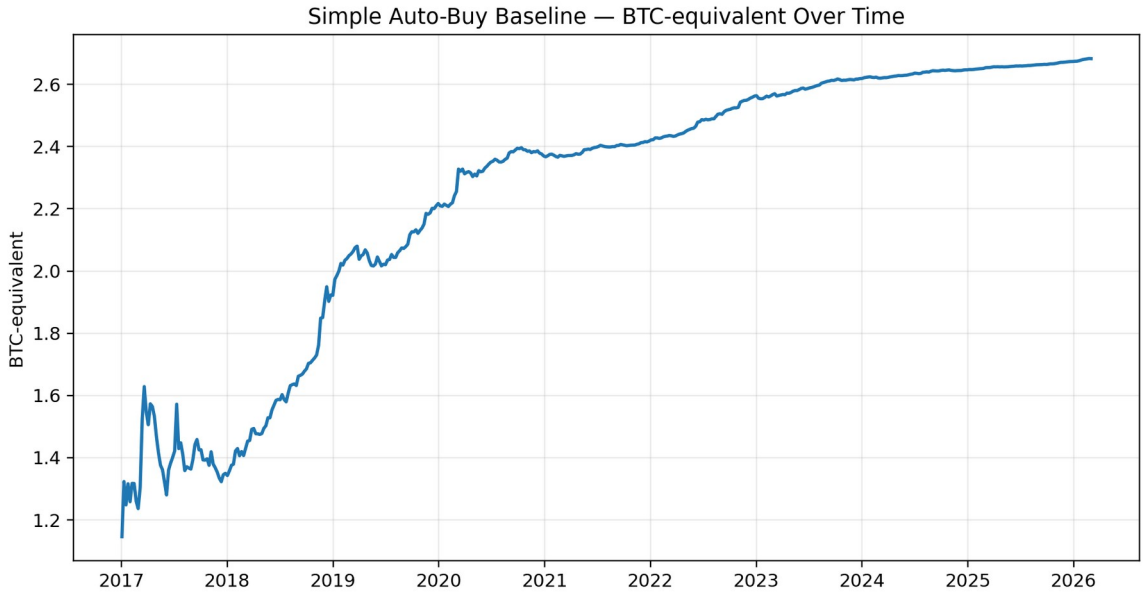

Figure: The fixed-schedule weekly-buy baseline BTC-equivalent path under the same standardized assumptions.

Walk-forward validation snapshot

The release-state materials also include nine out-of-sample three-year windows comparing AZRO Balanced to the best registered baseline in each window. This is useful because it tests the process on future windows rather than only on one long retrospective example.

- Lower maximum drawdown in 9 of 9 windows versus the best registered baseline in each window.
- Higher BTC-equivalent result in 6 of 9 windows versus the best registered baseline in each window.
- Median BTC-equivalent delta: +10.4%.
- Mean BTC-equivalent delta: +7.3%.
- No registered baseline dominated an AZRO profile on BTC-equivalent plus maximum drawdown in the test windows.

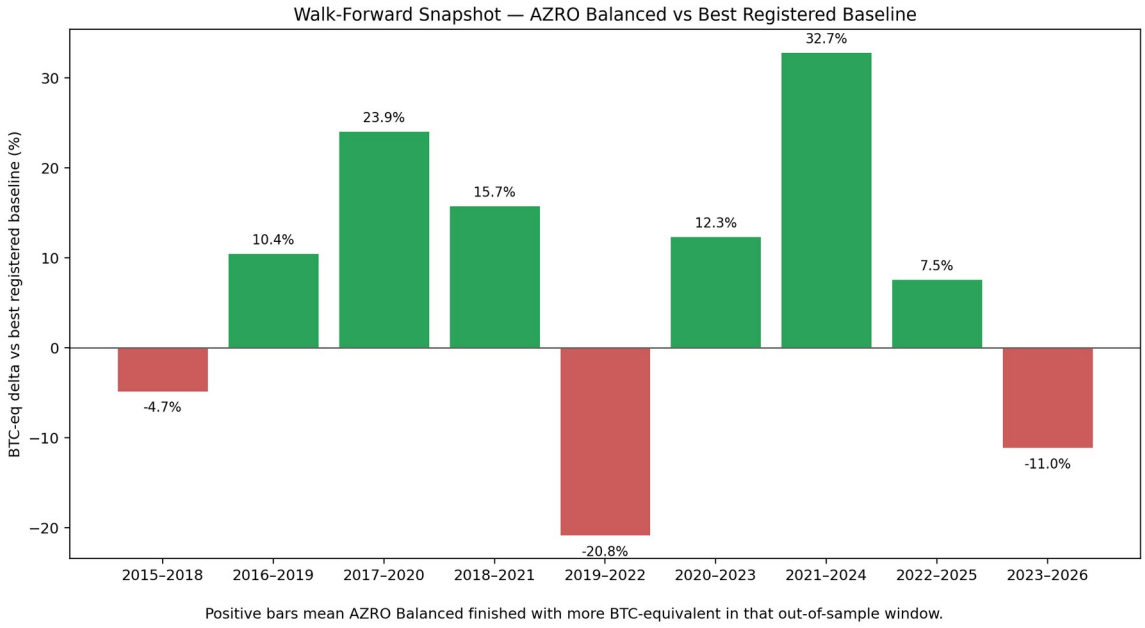

Figure: BTC-equivalent delta for AZRO Balanced versus the best registered baseline across the walk-forward windows.

Window	Best baseline	AZRO BTC-eq	Baseline BTC-eq	AZRO max DD	Baseline max DD
2015–2018	buy_hold_all	33.80	35.48	-34.7%	-35.1%
2016–2019	buy_hold_all	16.73	15.16	-78.3%	-82.5%
2017–2020	buy_hold_all	6.51	5.25	-64.6%	-79.9%
2018–2021	buy_hold_all	2.53	2.18	-43.7%	-45.5%
2019–2022	buy_hold_all	1.37	1.73	-39.8%	-45.9%
2020–2023	atr_trail	1.37	1.22	-33.1%	-41.3%
2021–2024	rsi_bands	0.71	0.54	-19.1%	-38.4%
2022–2025	buy_hold_all	0.54	0.50	-18.0%	-28.1%
2023–2026	buy_hold_all	0.34	0.38	-22.0%	-28.4%

Practical interpretation

The point of the validation file is not to imply certainty. It is to show that the customer release has a measurable benchmark, a release-state workbook, and a broader out-of-sample framework. Some windows still favor a simpler baseline. The value is that the customer can see that clearly and decide whether the added complexity is justified for their goals.

Limits and disclosures

- All examples are hypothetical and depend on modeled fees, taxes, and user execution discipline.
- A policy optimized for maximum BTC-equivalent behavior is not the same thing as a policy optimized for continuous BTC exposure or emotional comfort.
- Release-state results are tied to the current customer workbook and assumptions; changing assumptions changes outcomes.
- Past results do not guarantee future results.
